**RE: Traffic Impact Analysis, Rock Ledge, Town of Rhinebeck, Dutchess County, New York;
CM Project No. 114-053**

Dear Mr. Blaichman:

This letter documents a *Traffic Impact Analysis* conducted for the proposed *Rock Ledge* project located on Ackert Hook Road in the Town of Rhinebeck. This evaluation is based on the "Site Plan" dated March 31, 2018 prepared by Mark R. Graminski, P.E. L.S. P.C., Consulting Engineer & Land Surveyor, included under Attachment A.

1.0 Project Description

The project consists of the adaptive reuse and revitalization of an approximate 136-acre site that will be subdivided into a two-lot subdivision on the west side of Ackert Hook Road. The site is located within a Town of Rhinebeck Rural Countryside (RC5) Zoning District and is also a portion of the Rock Ledge Historic District listed on the National Register of Historic Places (1989) that contains five contributing buildings/site features (Manor House, Carriage House, Chapel, Gatehouse and two water storage tanks).

Lot One is an approximate 20-acre lot that will consist of the following uses:

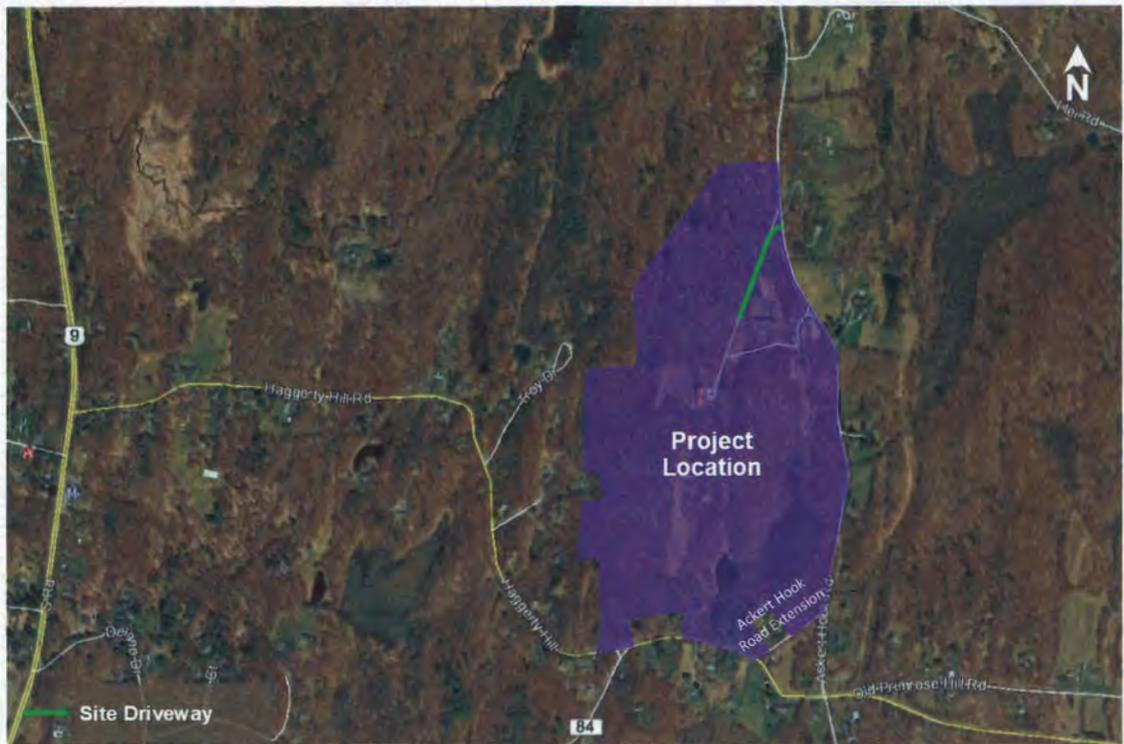

- Former Manor House repurposed as a Country Inn (10 of 12 total rooms)
- Former Chapel to contain two rooms of the Country Inn and an Inn guest spa
- Former Gatehouse building repurposed for security and concierge services
- Other related Inn accessory facilities including gardens and trails

Lot Two is an approximate 116-acre lot that will consist of the following uses:

- 28 residential condominium units in seven, 4-unit buildings
- HOA facilities and supporting infrastructure
- Former Carriage House repurposed as an HOA owners facility
- Former Dormitory building repurposed to include a maintenance facility and workshop, project and owner storage, gardening support space, and a caretaker apartment

The two existing driveways will be modified to provide access to the proposed development. The northernmost driveway on Ackert Hook Road will be realigned approximately 130 feet to the south and will provide full access to the site. The southernmost driveway on Ackert Hook Road will be restricted for emergency access only. The property contains existing water and

sewer facilities that will be upgraded as required for the proposed project. The project location is shown below.

2.0 Existing Conditions

Roadways Serving the Site

Ackert Hook Road is a local road generally providing north-south travel located between NY Route 9G and US Route 9 in the Town of Rhinebeck. Adjacent to the site, Ackert Hook Road is approximately 18 feet wide with no lane markings or pedestrian accommodations. The posted speed limit is 35-mph. and land uses along Ackert Hook Road include residential and undeveloped land.

Ackert Hook Road Extension serves as a connector road between Ackert Hook Road and Primrose Hill Road. Ackert Hook Road Extension is approximately 18 feet wide with no lane markings or pedestrian accommodations. There is no posted speed limit on Ackert Hook Road Extension. Land uses along Ackert Hook Road Extension include residential and undeveloped land.

Primrose Hill Road (CR 84) is a County road generally providing east-west travel between Old Albany Post Road and NY Route 9G in the Town of Rhinebeck. Near the site, Primrose Hill Road provides one 9 to 10-foot wide travel lane in each direction with six-inch to one-foot wide paved shoulders and no pedestrian accommodations. The posted speed limit is 40-mph and land uses along Primrose Hill Road include residential and undeveloped land. Local roads are co-used by walkers and cyclists.

Study Area Intersections

The Primrose Hill Road/Ackert Hook Road intersection is a four-way intersection located south of the project site operating under stop sign control on the northbound and southbound Ackert Hook Road approaches. Each approach provides a single lane for shared travel movements. Sidewalks are not provided at this intersection.

The Ackert Hook Road/Ackert Hook Road Extension intersection is a three-way intersection located south of the site operating under yield sign control on the eastbound Ackert Hook Road Extension approach. Each approach provides a single lane for shared travel movements. Sidewalks are not provided at this intersection.

The Primrose Hill Road/Ackert Hook Road Extension intersection is a three-way intersection located southwest of the project site operating under stop sign control on the westbound Ackert Hook Road Extension approach. Each approach provides a single lane for shared travel movements. Sidewalks are not provided at this intersection.

The Primrose Hill Road/Haggerty Hill Road intersection is a three-way intersection located southwest of the project site. This intersection forms a triangle as Haggerty Hill Road forks and intersects Primrose Hill Road via two separate two-way legs. The eastbound and westbound Primrose Hill Road approaches provide a single lane for shared travel movements. The southbound Haggerty Hill Road east and west approach legs to Primrose Hill Road each provide a single lane operating under stop sign control.

The US Route 9/Haggerty Hill Road intersection is a three-way intersection located west of the project site. The westbound Haggerty Hill Road approach provides a single lane for shared left and right turn movements operating under stop sign control. The northbound and southbound US Route 9 approaches provide two lanes for shared travel movements.

Data Collection

Automatic traffic recorders (ATRs) were installed by CM on five area roadways from October 16, 2015 through October 23, 2015. The volume and speed data collected from these ATRs is summarized in Table 1.

Table 1 – ATR Data Summary

Location (posted speed limit)	Traffic Volume (vehicles)		Travel Speed (mph)	
	Daily	Friday PM Peak Hour	Average	85 th Percentile
1. Haggerty Hill Rd (35-mph) 750 feet west of Primrose Hill Road	275	25	40	50
2. Primrose Hill Rd (40-mph) 250 feet east of Haggerty Hill Road	390	30	35	40
3. Ackert Hook Rd (35-mph) 600 feet south of Primrose Hill Road	185	10	35	30
4. Primrose Hill Rd (40-mph) 1,100 feet east of Ackert Hook Road	455	30	45	55
5. Ackert Hook Rd (35-mph) 350 feet north of Springwood Drive	215	20	35	40

Review of the daily traffic volumes shows that the study area roadways serve a small volume of traffic. With the exception of Primrose Hill Road, the study area roadways qualify as "Very

Low-Volume Local Roads" based on guidance presented by the American Association of State Highway and Transportation Officials (AASHTO) since the Average Daily Traffic (ADT) is less than 400 vehicles per day. The existing traffic volume and speed data is included under Attachment B.

Intersection turning movement counts were conducted during the afternoon peak period (4:00 to 6:00 p.m.) at the Primrose Hill Road/Ackert Hook Road, Ackert Hook Road/Ackert Hook Road Extension, and Primrose Hill Road/Ackert Hook Road Extension intersections on Friday, October 16, 2015 and at the Primrose Hill Road/Haggerty Hill Road and US Route 9/Haggerty Hill Road intersections on Friday, October 23, 2015. The raw traffic volume data is included under Attachment B. The 2015 existing Friday PM peak hour traffic volumes form the basis for all traffic forecasts and analysis and are shown on Figure 1.

Crash Analysis

Crash data was requested from NYSDOT to determine accident patterns on the project area roadway segments. Safety Information Management System (SIMS) and Accident Location Information System (ALIS) data was provided by NYSDOT for the following segments:

- Haggerty Hill Road – US Route 9 to Primrose Hill Road
- Primrose Hill Road – Haggerty Hill Road to Ackert Hook Road
- Ackert Hook Road – NY Route 9G to Vlei Road

Data was provided for a three-year period from January 1, 2015 to December 31, 2017. The crash data was reviewed to quantify the number of crashes and identify any abnormal crash patterns or concentrations. Table 2 summarizes the types of crashes on these project area roadways. Attachment C includes crash summaries and maps on the subject roadways.

Table 2 – Accident Summary

Location	Crash Class					Collision Type				Total
	Non-Reportable	Property Damage	Injury	Fatality	Total	Animal Action	Left Turn	Fixed Object	Rear-End	
Haggerty Hill Road	0	1	2	0	3	1	0	1	1	3
Primrose Hill Road	1	0	0	0	1		0	1	0	1
Ackert Hook Road	1	4	0	0	5	3	1	1	0	5
Total	2	5	2	0	9	4	1	3	1	9

¹ A non-reportable crash indicates no personal injuries occurred and property damages totaled less than \$1,000.

The following observations are evident from the crash history evaluation:

- Haggerty Hill Road – The three crashes along this segment include a rear-end collision, a vehicle colliding with a building/wall, and a collision with an animal.

- Primrose Hill Road – The single crash along this segment is a vehicle colliding with a building/wall.
- Ackert Hook Road – The five crashes along this segment include three collisions with an animal, one collision with a guiderail, and a left-turn accident.

Based on a review of the accident data, no discernable or prevalent crash types have been identified in the study area.

3.0 Traffic Assessment

Trip Generation

Trip generation determines the quantity of traffic expected to travel to/from a given site. The Institute of Transportation Engineers (ITE) *Trip Generation, 10th edition*, is the industry standard used for estimating trip generation for proposed land uses based on data collected at similar uses; however, ITE does not have a specific land use code for a "Country Inn," therefore the ITE trip generation rates for Hotel (land use code (LUC) 310), All Suites Hotel (LUC 311), and Motel (LUC 320) were compared and averaged in order to determine a trip generation rate for the 12-room Country Inn. Trip generation for the condominiums was estimated using LUC 260 – Recreational Homes.

In addition, the trip generation of the previous land use as a *Daytop* residential drug treatment facility was analyzed to determine how the traffic the site will generate with the proposed land use compares to the previous use. A representative of the previous use provided the following information regarding daily and occasional trips to and from the site:

- 30 to 35 daily staff
- 2 to 3 daily visitors
- 5 vans daily providing transportation for clients to various appointments
- Food delivery once per week
- Garbage collected twice per week
- Office and treatment supplies delivered once per month
- Treatment plant sludge removed once every three months

It is anticipated that most of the trips generated by these previous uses likely occurred outside the Friday PM peak hour. ITE LUCs for similar facilities such as an Assisted Living development (LUC 254) and a Nursing Home (LUC 620) were used to determine an approximate range of trips generated by the former drug treatment facility. The Friday PM peak hour trip generation comparison between the former site and the proposed site is summarized in Table 3.

Table 3 – Trip Generation Summary Comparison

Land Use	Friday PM Peak Hour		
	Enter	Exit	Total
Former Site Traffic			
Drug Treatment Facility	3	6	9
Proposed Site Traffic			
Country Inn	3	2	5
Condominiums	18	13	31
Proposed Land Uses Trip Generation	21	15	36
Difference Between Former and Proposed	+18	+9	+27

The proposed redevelopment is expected to generate 36 total trips during the Friday PM peak hour. The overall site redevelopment is anticipated to result in an overall increase of 27 vehicle trips at the site during the Friday PM peak hour. This magnitude of traffic is less than the NYSDOT and ITE threshold of 100 site-generated vehicles on any one intersection approach for needing off-site intersection analysis. This guidance was developed as a tool to identify locations where the magnitude of traffic generated has the potential to impact operations at off site intersections and screen out locations from requiring detailed analysis that do not reach the 100 vehicle threshold and are unlikely to have impacts. It is noted that a detailed traffic evaluation was conducted at the study area intersections and at the site driveway since it was determined that the surrounding residential area is part of a Town of Rhinebeck RC5 Zoning District and that several roadways near the site are "Very Low-Volume Local Roads" based on AASHTO guidance.

Future Traffic Volumes

Traffic generated by the proposed project was distributed at the Site Driveway intersection based on existing travel patterns and probable travel routes of residents and/or guests to and from the site. It is expected that while most trips entering the site during the Friday PM peak hour will consist of residents and/or guests arriving for an extended stay, most trips exiting the site during the same period will consist of residents and/or guests making trips to local destinations such as grocery stores or restaurants; therefore, it is expected that the origins of trips entering the site will not match the destinations of trips exiting the site, as is commonly expected for typical land uses.

Based on this knowledge, it is estimated that, of the site generated trips entering the site, approximately 65 percent will travel from the south and east while remaining 35 percent will travel from the north and west. It is also estimated that, of the site generated trips exiting the site, approximately 20 percent will travel to the south and east while the remaining 80 percent will travel to the north and west. The detailed trip distribution patterns for the proposed site are shown on Figure 2. The resulting trip assignments for the proposed development are shown on Figure 3. The overall trip assignment results in an increase of 14 trips south and east of the site via the NY Route 9G corridor, four trips south and west of the site via US Route 9, 10 trips north and west of the site via US Route 9, and eight trips north of the site via Ackert Hook Road. The results of the site generated traffic assignment were added to the Existing traffic volumes to develop the Build traffic volumes. The Build traffic volumes are shown on Figure 4 and represent the future traffic conditions after completion of the project.

Traffic Operations

Intersection Level of Service (LOS) and capacity analysis relate traffic volumes to the physical characteristics of an intersection. Intersection evaluations were made using the Synchro 10 software which automates the procedures contained in the *Highway Capacity Manual*. Levels of service range from A to F with LOS A considered excellent with very little delay while LOS F represents conditions with very long delays. Attachment D contains further detailed descriptions of LOS criteria for unsignalized intersections and copies of the detailed level of service reports. Table 4 shows the results of the Level of Service calculations for the Friday PM peak hour.

Table 4 – Level of Service Summary

Intersection	Control	Friday PM Peak Hour	
		Existing	Build
Primrose Hill Road/Ackert Hook Road	U	A (7.2)	A (7.3)
		A (7.2)	A (7.2)
		A (9.0)	A (9.1)
		A (9.1)	A (9.1)
Ackert Hook Road/Ackert Hook Road Extension	U	A (8.6)	A (8.8)
		A (0.7)	A (0.3)
Primrose Hill Road/Ackert Hook Road Extension	U	A (7.3)	A (7.3)
		A (8.5)	A (8.5)
Primrose Hill Road/Haggerty Hill Road	U	A (7.2)	A (7.2)
		A (8.6)	A (8.7)
		A (8.3)	A (8.3)
		A (8.6)	A (8.7)
US Route 9/Haggerty Hill Road	U	B (10.6)	B (10.5)
		A (8.2)	A (8.2)
Ackert Hook Road/Site Driveway	U	--	A (8.6)
		--	A (7.3)

Key: X (Y.Y) = Level of Service (Delay, seconds per vehicle).

U = Unsignalized intersections.

NB, SB, WB, EB = Northbound, Southbound, Westbound, Eastbound intersection approaches.

LTR = Left-turn, through, and/or right-turn movements

Table 4 indicates that all movements at each intersection currently operate at LOS A/B during the Friday PM peak hour. The analysis indicates that these intersection movements will continue to operate at the same levels of service after full build-out of the proposed development with an increase in average vehicle delay of less than one second on any movement. No site specific geometric mitigation is recommended at any of these locations.

Roadway Assessment

The study area roadways are functionally classified as local roads whose primary function is to provide direct access to single-family homes and other neighborhood uses. The adequacy of a roadway is typically defined by the available capacity. Information published by the Capital District Transportation Committee (CDTC) states that local roads have the ability to accommodate 625 vehicles per hour in each direction (approximately 1,250 total vehicles) which is almost three to seven times the daily traffic experienced on the study roadways. Based on this information and a review of Table 1, the study area roadways currently have more than sufficient capacity to accommodate additional traffic. A more applicable measure of potential study area impacts is how acceptable the roadway environment is for residential uses.

The quality of life provided by a roadway is typically assessed through performance measures involving accessibility, safety, and air/noise pollution. When analyzing very low-volume local roads such as those serving the site, minor increases in traffic volumes may adversely affect the quality of life of residents and users of the roadway. However, it may not necessarily result in significant worsening of accessibility, safety, or pollution in the area that would result in unacceptable conditions based on more widely accepted standards.

An article titled *How Much Is Too Much (Traffic)* found in the ITE Journal (May 1982) published by ITE summarizes vehicle thresholds associated with quality of life issues for residents along local roads with respect to traffic volumes. Table 5 summarizes these traffic volume thresholds.

Table 5 – Local Road Environmental Quality Summary

Daily Traffic Volume (vehicles per day)	Environmental Rating
< 300	Excellent
300 to 600	Good
600 to 1,200	Acceptable
> 1,200	Poor

Source: Spitz, S. P.E. (1982). How Much Is Too Much (Traffic). *ITE Journal*, May 1982, pp. 44-45.

A review of the existing daily traffic volumes on the study area roadways as compared to the traffic volume thresholds in Table 5 shows that the study area roadways are environmentally rated as "Good" to "Excellent" for residential roads.

In order to determine the level of impact to the existing traffic volume environmental rating of the roadways serving the site, a "K factor" was calculated for each of the five roadway segments from which daily traffic volume data was collected. A "K factor" is the proportion of annual average daily traffic (AADT) occurring during the peak hour. The K factors were used to calculate the number of new daily trips generated by the site on the study area roadways. These new trips were added to the existing daily trips to determine the expected daily trips on each study area roadway segment after completion of the project. Table 6 summarizes the results of the roadway segment volume assessment.

Table 6 – Build Condition Daily Volume Summary

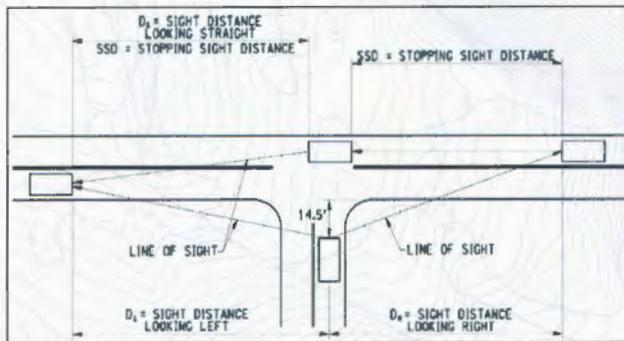

Location	K Factor	Site Generated Traffic (vehicles)		Daily Segment Volumes (vehicles)	
		Friday PM Peak Hour Trips	Daily Volume	Existing Conditions	Build Condition
1. Haggerty Hill Rd 750 ft west of Primrose Hill Road	0.09	12	135	275	410
2. Primrose Hill Rd 250 ft east of Haggerty Hill Road	0.08	14	175	390	565
3. Ackert Hook Rd 600 ft south of Primrose Hill Road	0.05	2	40	185	225
4. Primrose Hill Rd 1,100 ft east of Ackert Hook Road	0.07	12	170	455	625
5. Ackert Hook Rd 350 ft north of Springwood Drive	0.09	28	310	215	525

Based on the environmental rating thresholds volumes in Table 5, the segment of Ackert Hook Road south of Primrose Hill Road will maintain an “Excellent” environmental rating through completion of the project. The segment of Primrose Hill Road east of Haggerty Hill Road will also maintain a “Good” environmental rating through project completion. The environmental rating for Haggerty Hill Road and the segment of Ackert Hook Road north of Springwood Drive will change from “Excellent” to “Good” while the segment of Primrose Hill Road east of Ackert Hook Road will change from “Good” to “Acceptable”. A review of roadway conditions indicates that “Acceptable” to “Excellent” traffic volume environmental ratings will be provided after completion of the project.

4.0 Sight Distance Evaluation

A sight distance evaluation was completed at the proposed Site Driveway intersection on Ackert Hook Road. Available *intersection* sight distance was measured from the perspective of a vehicle exiting the Site Driveway. In addition, the sight distance for traveling along Ackert Hook Road looking straight ahead to turn left into the Site Driveway was measured. The available intersection sight distance on a side street should provide drivers a sufficient view of the intersecting highway to allow vehicles to enter or exit the intersection without excessively slowing vehicles traveling at or near the operating speed on the intersecting mainline.

Stopping sight distance was also measured at the Site Driveway intersection. Stopping sight distance is the length of the roadway ahead that is visible to the driver. The available stopping sight distance on a roadway should be of sufficient length to enable a vehicle traveling at or near the operating speed to stop before reaching a stationary object in its path. The following diagram illustrates these sight distance measurements.

Sight Distance Measurements

Travel speed data collected by CM in the vicinity of the Site Driveway shows that the 85th percentile travel speed on Ackert Hook Road is 40-mph in the northbound and southbound directions. The sight distances measured in the field were compared to the guidelines presented in the American Association of State Highway Transportation Officials (AASHTO) *A Policy on Geometric Design of Highways and Streets 2011* for a 40-mph operating speed. The results of the sight distance analysis are summarized in Table 7.

Table 7 – Sight Distance Summary (Feet)

Intersection	Intersection Sight Distance ¹				Stopping Sight Distance ²	
	Right Turn from Site Driveway (D _L)	Left Turn from Site Driveway		Left Turn from Ackert Hook Road (D _S)	SSD _{NB}	SSD _{SB}
		Looking Left (D _L)	Looking Right (D _R)			
Ackert Hook Road/ Site Driveway	Available	750	750	460	800	445
	Recommended ³	385	445	445	325	285 ⁴
						275

¹ = Intersection sight distance is measured at 14.5 feet back from the travel way at an eye height of 3.5-ft and object height of 3.5-ft.

² = SSD_{NB, SB} = Stopping sight distance measured for a 2-foot object located in the path of northbound and southbound vehicles on Ackert Hook Road.

³ = Sight distance measurements are compared to AASHTO recommended distances for a 40-mph operating speed on a Non-National Highway System (Non-NHS) road.

⁴ = The recommended stopping sight distance value reflects a 2.7% downgrade on the northbound approach to the Site Driveway.
 XX = Available sight distance

The sight distance evaluation indicates that the available intersection sight distances at the Ackert Hook Road/Site Driveway intersection and the stopping sight distances in either direction along Ackert Hook Road meet AASHTO guidelines for the 40-mph operating speed. No mitigation beyond maintaining the existing sight lines is recommended. The available sight lines looking left and right at this location are shown in Photographs 1 and 2.

Photograph #1 – Sight Distance Looking Left

Photograph #2 – Sight Distance Looking Right

It is noted that the lack of paved shoulders on Ackert Hook Road and other study area roadways requires bicyclists to share the road. During the Friday PM peak period intersection turning movement counts, a small number of pedestrians and bicyclists were observed.

5.0 Conclusions

The proposed project consists of the adaptive reuse and revitalization of the existing *Rock Ledge* site and the development of a County Inn with supporting services and 28 residential condominiums and owner facilities. The project is on an approximate 136-acre site to be subdivided into a two-lot subdivision located on the west side of Ackert Hook Road north of Primrose Hill Road. The two existing driveways will be modified to provide access to the proposed development. The northernmost driveway on Ackert Hook Road will be realigned approximately 130 feet to the south and will provide full access to the site. The southernmost driveway on Ackert Hook Road will be restricted for emergency access only. The proposed redevelopment of the site is expected to generate 36 new vehicle trips during the Friday PM peak hour. The following traffic summary is noted regarding the proposed project:

- Review of the latest three years of crash data shows that there are no discernable or prevalent crash patterns in the study area on Haggerty Hill Road, Primrose Hill Road, and Ackert Hook Road.
- The available intersection and stopping sight distances at the proposed Site Driveway meet AASHTO guidelines for the applicable operating speed.
- The magnitude of traffic generated by the site on any one approach for off-site intersections will be less than the NYSDOT and ITE threshold of 100 site-generated vehicles.
- The expected trips generated by the site will result in an increase of 18 trips south and east of the site and 18 trips north and west of the site during the Friday PM peak hour.
- The analysis indicates that the study area intersections and the Site Driveway intersection will continue to operate at good levels of service (LOS A/B) during the Friday PM peak hour after full build-out of the proposed development with an increase of average vehicle delay less than one second on any movement. No site-specific geometric mitigation is recommended.
- A review of daily traffic volumes compared to ITE thresholds for identifying environmental ratings on residential roads shows that the study area roadways will be "Acceptable" to "Excellent" after completion of the project.

If you have any questions regarding the above analysis, please feel free to contact our office.

PROPOSED USE NOTES

1. FORMER DORMITORY BUILDING:

- HOA - owner storage
- Country Inn & HOA maintenance workshop, equipment and supplies storage
- Sustainable Wood workshop
- Garden activities support/storage
- Agriculture support space storage

2. FORMER DORMITORY BUILDING OUTSIDE AREA:

- Garden
- Other Agriculture (food, herbs, flowers, bee-keeping)
- Remote parking facility

3. COUNTRY INN & HOA GATE HOUSE:

- Security
- Concierge services
- Parking pick up
- Guest Suites
- Spa
- Remote parking

5. EXISTING WASTEWATER TREATMENT PLANT:

- Exterior aesthetic treatment
- Sound attenuation treatment

6. COUNTRY INN 1

- Guest Suites
- Restaurant/Bar
- Administration

7. FORMER INFIRMARY BUILDING

- Temporary construction office and then demolition

8. HOA RECREATION FACILITY

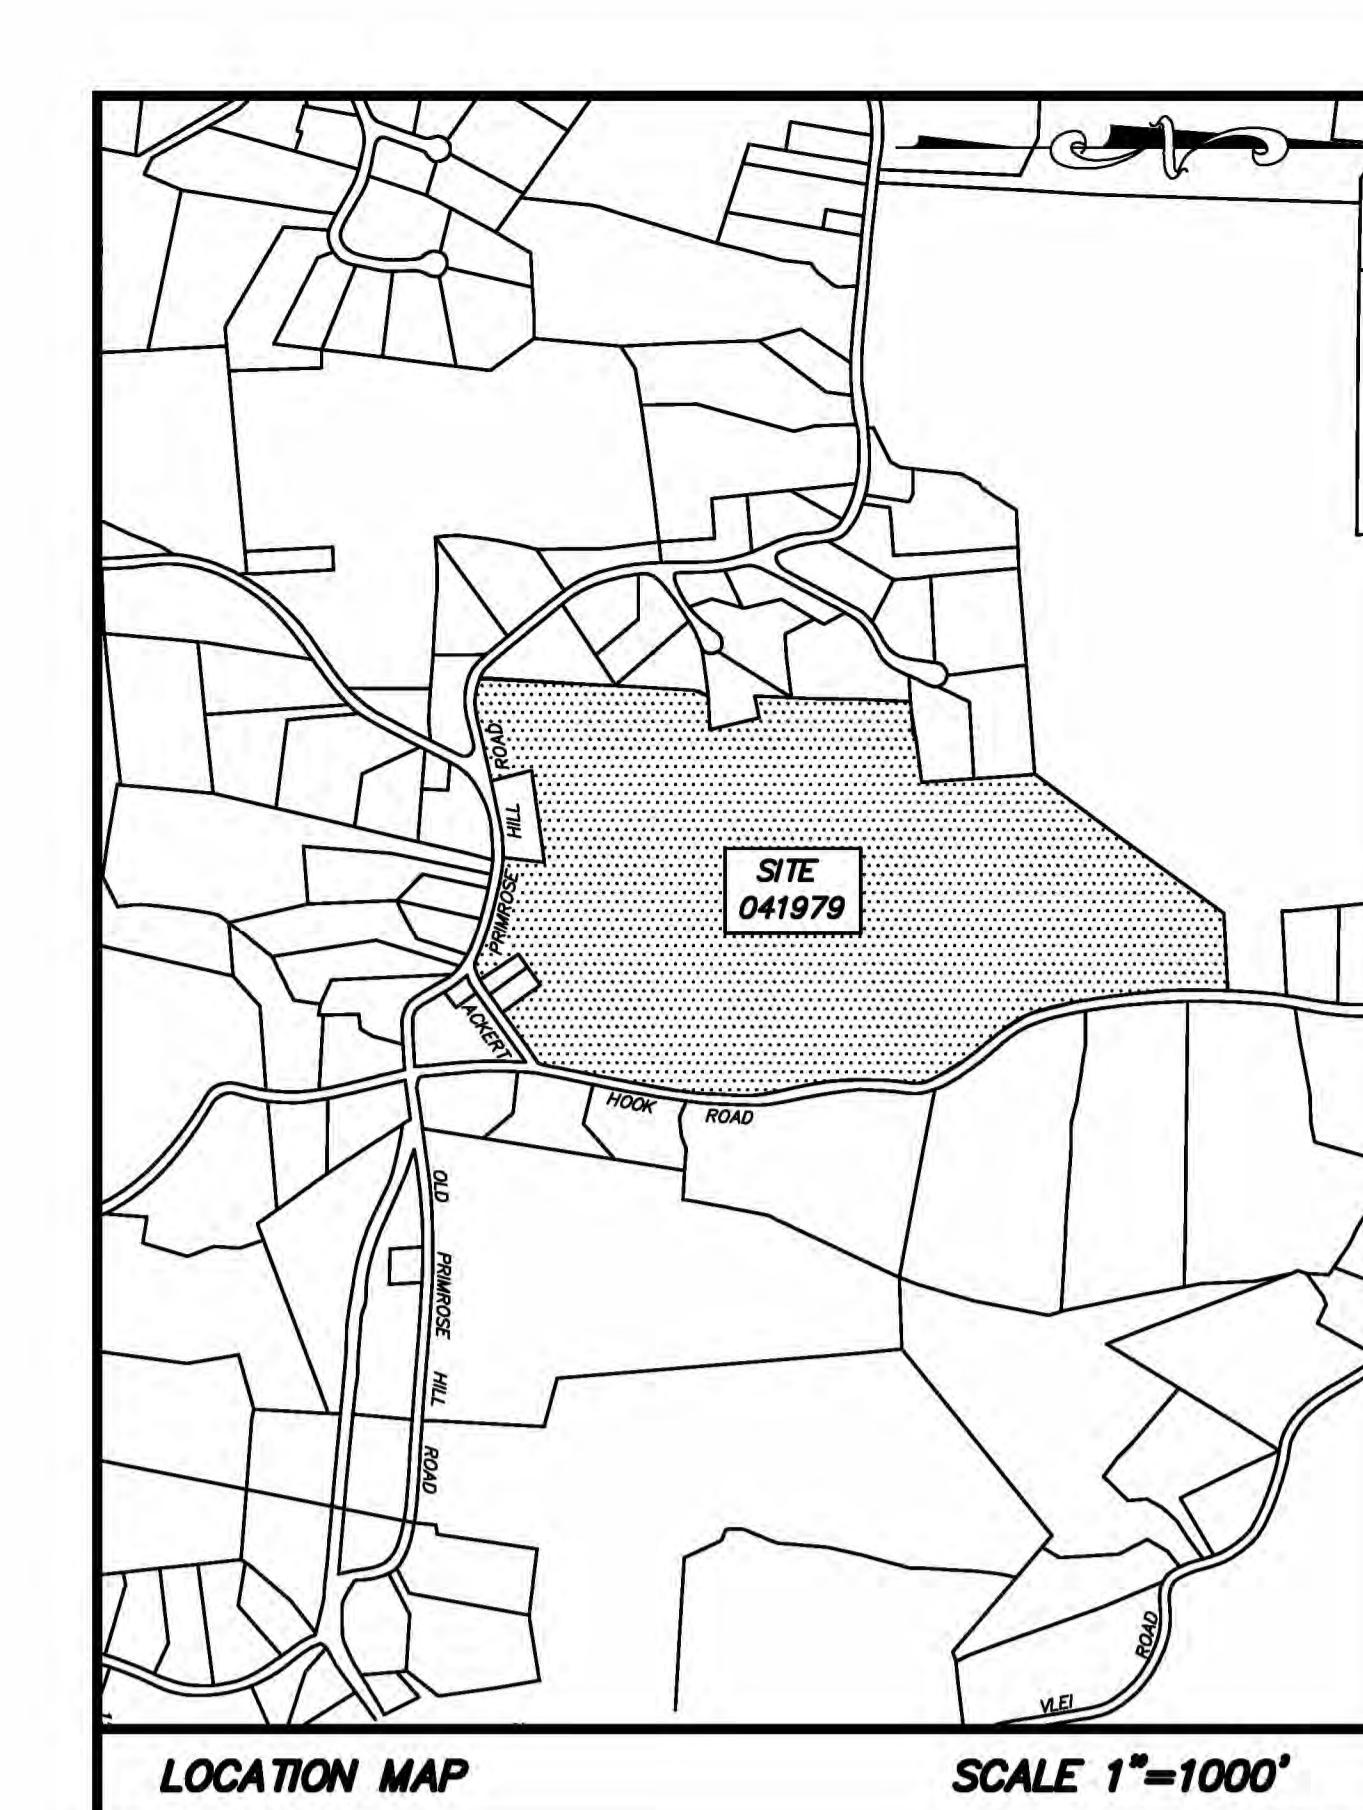

- Gym/Exercise rooms
- Pool and pool area

9. FORMER MAINTENANCE STRUCTURES:

- Temporary construction uses and then demolition

10. WATER STORAGE TANKS:

- To remain

Level of Service Analysis

Rock Ledge
Town of Rhinebeck, New York

LOS Definitions

The following is an excerpt from the [2010 Highway Capacity Manual \(HCM\)](#).

Level of Service for Signalized Intersections

Level of Service (LOS) can be characterized for the entire intersection, each intersection approach, and each lane group. Control delay alone is used to characterize LOS for the entire intersection or an approach. Control delay *and* volume-to-capacity (*v/c*) ratio are used to characterize LOS for a lane group. Delay quantifies the increase in travel time due to traffic signal control. It is also a surrogate measure of driver discomfort and fuel consumption. The *v/c* ratio quantifies the degree to which a phase's capacity is utilized by a lane group. The following paragraphs describe each LOS.

LOS A describes operations with a control delay of 10 s/veh or less and a *v/c* ratio no greater than 1.0. This level is typically assigned when the *v/c* ratio is low and either progression is exceptionally favorable or the cycle length is very short. If it is due to favorable progression, most vehicles arrive during the green indication and travel through the intersection without stopping.

LOS B describes operations with control delay between 10 and 20 s/veh and a *v/c* ratio no greater than 1.0. This level is typically assigned when the *v/c* ratio is low and either progression is highly favorable or the cycle length is short. More vehicles stop than with LOS A.

LOS C describes operations with control delay between 20 and 35 s/veh and a *v/c* ratio no greater than 1.0. This level is typically assigned when progression is favorable or the cycle length is moderate. Individual *cycle failures* (i.e., one or more queued vehicles are not able to depart as a result of insufficient capacity during the cycle) may begin to appear at this level. The number of vehicles stopping is significant, although many vehicles still pass through the intersection without stopping.

LOS D describes operations with control delay between 35 and 55 s/veh and a *v/c* ratio no greater than 1.0. This level is typically assigned when the *v/c* ratio is high and either progression is ineffective or the cycle length is long. Many vehicles stop and individual cycle failures are noticeable.

LOS E describes operations with control delay between 55 and 80 s/veh and a *v/c* ratio no greater than 1.0. This level is typically assigned when the *v/c* ratio is high, progression is unfavorable, and the cycle length is long. Individual cycle failures are frequent.

LOS F describes operations with control delay exceeding 80 s/veh or a *v/c* ratio greater than 1.0. This level is typically assigned when the *v/c* ratio is very high, progression is very poor, and the cycle length is long. Most cycles fail to clear the queue.

A lane group can incur a delay less than 80 s/veh when the *v/c* ratio exceeds 1.0. This condition typically occurs when the cycle length is short, the signal progression is favorable, or both. As a result, both the delay and *v/c* ratio are considered when lane group LOS is established. A ratio of 1.0 or more indicates that cycle capacity is fully utilized and represents failure from a capacity perspective (just as delay in excess of 80 s/veh represents failure from a delay perspective).

- Average control delay and queue length at roundabout controlled intersections are calculated using SIDRA Intersection. The physical geometry such as entry lane width and approach flare, and traffic volume at the roundabout are factors that influence the intersection's performance. The average delay reported using SIDRA Intersection is based on the signalized HCM Method of Delay for Level-of-Service.

Level of Service Criteria for Unsignalized Intersections

Level of service (LOS) for Two-Way Stop-Controlled (TWSC) intersections is determined by the computed or measured control delay. For motor vehicles, LOS is determined for each minor-street movement (or shared movement) as well as major-street left turns by using criteria given in Exhibit 19-1. LOS is not defined for the intersection as a whole or for major-street approaches for three primary reasons: (a) major-street through vehicles are assumed to experience zero delay; (b) the disproportionate number of major-street through vehicles at a typical TWSC intersection skews the weighted average of all movements, resulting in a very low overall average delay for all vehicles; and (c) the resulting low delay can mask important LOS deficiencies for minor movements. LOS F is assigned to the movement if the volume-to-capacity (v/c) ratio for the movement exceeds 1.0, regardless of the control delay.

The LOS criteria for TWSC intersections are somewhat different from the criteria used in Chapter 18 for signalized intersections, primarily because user perceptions differ among transportation facility types. The expectation is that a signalized intersection is designed to carry higher traffic volumes and will present greater delay than an unsignalized intersection. Unsignalized intersections are also associated with more uncertainty for users, as delays are less predictable than they are at signals, which can reduce users' delay tolerance.

The LOS criteria for All-Way Stop-Controlled (AWSC) intersections are given in Exhibit 20-2. LOS F is assigned if the v/c ratio of a lane exceeds 1.0, regardless of the control delay. For assessment of LOS at the approach and intersection levels, LOS is based solely on control delay.

**Exhibits 19-1/20-2:
Level-of-Service Criteria for Stop Controlled Intersections**

Control Delay (s/veh)	LOS by Volume-to-Capacity Ratio	
	$v/c \leq 1.0$	$v/c \geq 1.0$
10.0	A	F
>10.0 and \leq 15.0	B	F
>15.0 and \leq 25.0	C	F
>25.0 and \leq 35.0	D	F
>35.0 and \leq 50.0	E	F
>50.0	F	F
